MANAGED SERVICES

Reliable and affordable managed security and data protection

Organizations depend on the Internet to exchange information—to better serve customers, support business relationships and be more competitive. However, organizations have to protect themselves against potential Internet and e-mail threats as well as preserve their precious data to secure the viability of their company. The US Bureau of Labor states “93% of all companies that experience significant data loss are out of business within 5 years.”

Coping with the constant onslaught of sophisticated malicious attacks and the flood of vulnerabilities has become more and more challenging. IT managers are frustrated by the multitude of independent point solutions—solutions that often lack basic integration and interoperability of even standard features. And business managers are concerned with the potential exposure associated with various regulatory requirements. Strict fines and negative publicity can result if security and data backup and recovery systems are not properly configured, managed and maintained.

SonicWALL Managed Services

SonicWALL® has teamed up with a group of independent managed service providers, specializing in outsourcing IT services. Whether an organization wants to offload some basic—often time consuming—IT responsibilities, outsource complete offsite management of their network or anything in between, Managed Service Providers will tailor a solution to fit key business requirements and help free up time to work on the important initiatives that ultimately support the growth and direction of an organization.

Features and Benefits

Access to experts – Initially, work with a security and data protection expert to define policies that meet business objectives and provide up-to-the-minute security and data protection. Then, extend IT resources with ongoing access to expert advice for support as new business opportunities and IT challenges arise.

Affordable enterprise-class protection – Leveraging the economies of scale, Managed Service Providers offer the same products, services, management, reporting and expertise found in enterprises at a fraction of the cost of bringing everything in house.

Rapid response – Detailed monitoring and reporting ensure a timely response to alerts and rapid resolution of security issues. IT managers no longer have to be on call 24x7. The managed service provider ensures continuous uptime of the network.

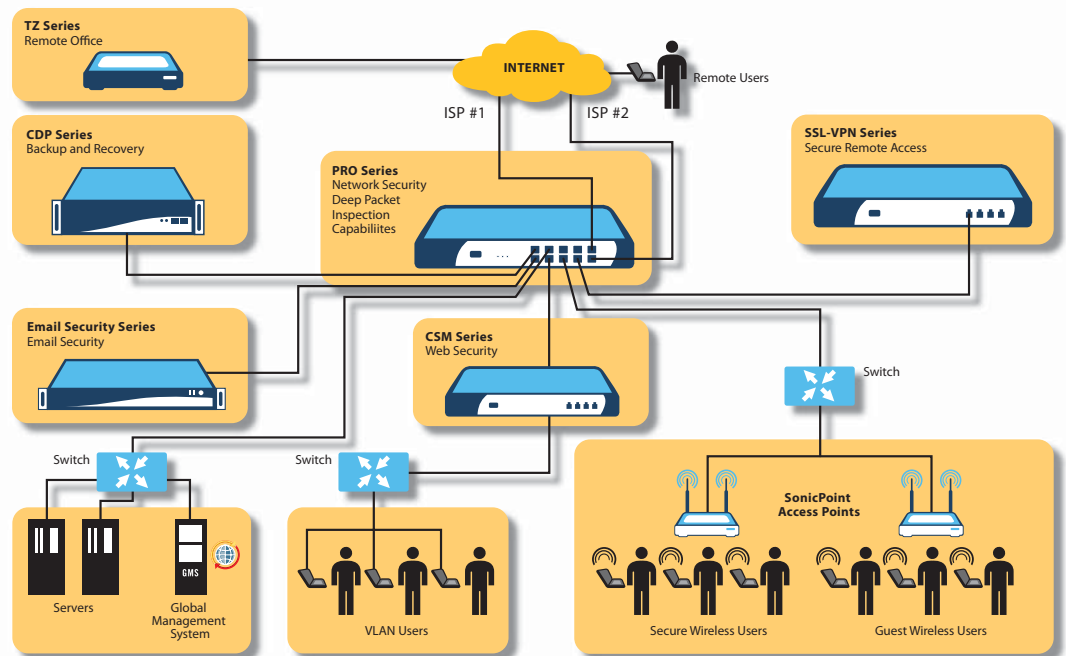

Predictable costs – Cost structure and fees are predictable based on the selected services. Cost savings are generally visible within 90 days of engaging a Managed Service Provider.

Productivity savings – With so many point solutions put together, even an initial optimization of current systems begin to save organizations money and increase network bandwidth and performance. Smooth-running systems eliminate downtime and data loss, reducing internal staffing costs and freeing existing staff to focus on key activities.

- Access to experts
- Affordable enterprise-class protection
- Rapid response
- Predictable costs
- Productivity savings

SonicWALL Managed Services

The SonicWALL Protected Network

Network Security Solutions

SonicWALL provides all-in-one security solutions which are based upon deep packet inspection firewall and IPSec VPN technologies with integrated gateway anti-virus, anti-spyware, intrusion prevention, enforced desktop anti-virus, content filtering and secure wireless capabilities.

Secure Remote Access

The SonicWALL line-up of VPN solutions provide organizations of all sizes with two easy ways to provide secure access to corporate resources through broadband, wireless and dial-up connections from remote locations. IPSec VPN is integrated in all TZ and PRO Series security appliances. It uses encryption and authentication technology to create a secure, private tunnel through an IP network for site-to-site connections. Or, by deploying a SonicWALL SSL-VPN solution along side an existing firewall with no per-seat license fees, organizations can easily provide mobile workers with secure remote access through a standard Web browser. And, because it uses a Web-based interface, there is no need for managing a pre-installed client, making the task of offering remote access a breeze for an already overtaxed IT staff.

Web and E-mail Security Solutions

SonicWALL E-mail Security solutions provide effective, high-performance and easy-to-use inbound and outbound e-mail threat protection against spam, virus and phishing attacks while preventing internal policy and regulatory compliance violations. SonicWALL Web Security solutions integrate Web filtering and real-time gateway anti-virus and anti-spyware to deliver maximum network protection in a single appliance that fits behind an existing firewall.

Backup and Recovery

SonicWALL Backup and Recovery solutions provide automatic, real-time disk-based data backup for servers, laptops and PCs. The Continuous Data Protection (CDP) Series backs up files locally to ensure previous file versions can be recovered instantly. It also includes hands-free, automatic offsite capabilities that satisfy an organization's disaster recovery requirements. And, since SonicWALL CDP only backs up block level differences within each file, the network is not impacted or compromised. Importantly, central management and remote administration features allow a managed service provider or IT administrator to operate efficiently and effectively.
